**ROLL NO.:** 542

### Q.1) Write a Program for Randomized Selection Algorithm

```
from random import randrange

def partition(x, pivot_index = 0):

    i = 0

    if pivot_index != 0: x[0],x[pivot_index] = x[pivot_index],x[0]

    for j in range(len(x)-1):

        if x[j+1] < x[0]:

            x[j+1],x[i+1] = x[i+1],x[j+1]

            i += 1

    x[0],x[i] = x[i],x[0]

    return x,i

def RSelect(x,k):

    if len(x) == 1:

        return x[0]

    else:

        xpart = partition(x,randrange(len(x)))

        x = xpart[0] # partitioned array

        j = xpart[1] # pivot index

        if j == k:

            return x[j]

        elif j > k:

            return RSelect(x[:j],k)

        else:
```

```
k = k - j - 1
```

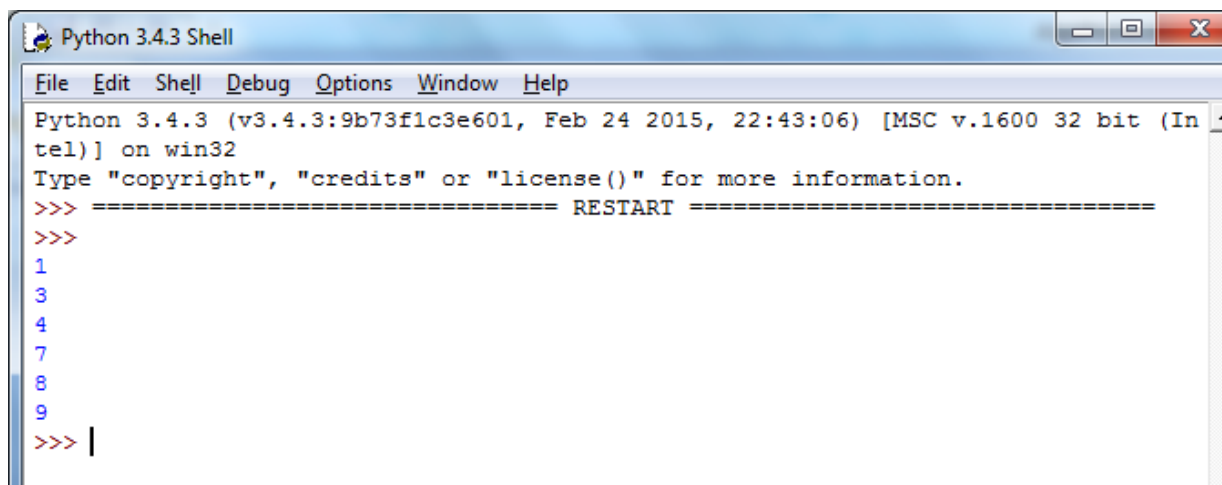

```
return RSelect(x[(j+1):], k)
```

```
x = [3,1,8,4,7,9]
```

```
for i in range(len(x)):
```

```
    print (RSelect(x,i))
```

Output:

A screenshot of a Python 3.4.3 Shell window. The window title is "Python 3.4.3 Shell". The menu bar includes "File", "Edit", "Shell", "Debug", "Options", "Window", and "Help". The main text area shows the following content: "Python 3.4.3 (v3.4.3:9b73f1c3e601, Feb 24 2015, 22:43:06) [MSC v.1600 32 bit (Intel)] on win32", "Type \"copyright\", \"credits\" or \"license()\" for more information.", a prompt ">>> ===== RESTART =====", another prompt ">>>", and then a list of numbers: 1, 3, 4, 7, 8, 9, followed by a prompt ">>> |".

## Q.2) Write a Program for Heap Sort Algorithm

Python program for implementation of heap Sort

```
# To heapify subtree rooted at index i.
# n is size of heap
def heapify(arr, n, i):
    largest = i # Initialize largest as root
    l = 2 * i + 1 # left = 2*i + 1
    r = 2 * i + 2 # right = 2*i + 2

    # See if left child of root exists and is
    # greater than root
    if l < n and arr[i] < arr[l]:
        largest = l

    # See if right child of root exists and is
    # greater than root
    if r < n and arr[largest] < arr[r]:
        largest = r

    # Change root, if needed
```

```

        if largest != i:
            arr[i],arr[largest] = arr[largest],arr[i]    # swap

            # Heapify the root.
            heapify(arr, n, largest)

# The main function to sort an array of given size
def heapSort(arr):
    n = len(arr)

    # Build a maxheap.
    for i in range(n, -1, -1):
        heapify(arr, n, i)

    # One by one extract elements
    for i in range(n-1, 0, -1):
        arr[i], arr[0] = arr[0], arr[i]    # swap
        heapify(arr, i, 0)

# Driver code to test above
arr = [ 12, 11, 13, 5, 6, 7]
heapSort(arr)
n = len(arr)
print ("Sorted array is")
for i in range(n):
    print ("%d" %arr[i]),

```

Output:

```

Sorted array is
5 6 7 11 12 13

```

### 3) Write a Program to perform Radix Sort Algorithm

Python program for implementation of Radix Sort

```

# A function to do counting sort of arr[] according to
# the digit represented by exp.
def countingSort(arr, exp1):

    n = len(arr)

    # The output array elements that will have sorted arr
    output = [0] * (n)

    # initialize count array as 0
    count = [0] * (10)

    # Store count of occurrences in count[]
    for i in range(0, n):

```

```

        index = (arr[i]/exp1)
        count[ (index)%10 ] += 1

# Change count[i] so that count[i] now contains actual
# position of this digit in output array
for i in range(1,10):
    count[i] += count[i-1]

# Build the output array
i = n-1
while i>=0:
    index = (arr[i]/exp1)
    output[ count[ (index)%10 ] - 1] = arr[i]
    count[ (index)%10 ] -= 1
    i -= 1

# Copying the output array to arr[],
# so that arr now contains sorted numbers
i = 0
for i in range(0,len(arr)):
    arr[i] = output[i]

# Method to do Radix Sort
def radixSort(arr):

    # Find the maximum number to know number of digits
    max1 = max(arr)

    # Do counting sort for every digit. Note that instead
    # of passing digit number, exp is passed. exp is 10^i
    # where i is current digit number
    exp = 1
    while max1/exp > 0:
        countingSort(arr,exp)
        exp *= 10

# Driver code to test above
arr = [ 170, 45, 75, 90, 802, 24, 2, 66]
radixSort(arr)

for i in range(len(arr)):
    print(arr[i]),

```

Output:

```
2 24 45 66 75 90 170 802
```

#### 4) Write a Program to Perform Bucket Sort Algorithm

```

# Python3 program to sort an array
# using bucket sort

```

```

def insertionSort(b):
    for i in range(1, len(b)):
        up = b[i]
        j = i - 1
        while j >= 0 and b[j] > up:
            b[j + 1] = b[j]
            j -= 1
        b[j + 1] = up
    return b

def bucketSort(x):
    arr = []
    slot_num = 10 # 10 means 10 slots, each
                  # slot's size is 0.1
    for i in range(slot_num):
        arr.append([])

    # Put array elements in different buckets
    for j in x:
        index_b = int(slot_num * j)
        arr[index_b].append(j)

    # Sort individual buckets
    for i in range(slot_num):
        arr[i] = insertionSort(arr[i])

    # concatenate the result
    k = 0
    for i in range(slot_num):
        for j in range(len(arr[i])):
            x[k] = arr[i][j]
            k += 1
    return x

# Driver Code
x = [0.897, 0.565, 0.656,
     0.1234, 0.665, 0.3434]
print("Sorted Array is")
print(bucketSort(x))

```

Output:

```

Sorted array is
0.1234 0.3434 0.565 0.656 0.665 0.897

```

### 5) Write a Program to Perform Floyd-Warshall algorithm

```

# Python Program for Floyd Warshall Algorithm

# Number of vertices in the graph
V = 4

```

```

# Define infinity as the large enough value. This value will be
# used for vertices not connected to each other
INF = 99999

# Solves all pair shortest path via Floyd Warshall Algorithm
def floydWarshall(graph):

    """ dist[][] will be the output matrix that will finally
        have the shortest distances between every pair of vertices """
    """ initializing the solution matrix same as input graph matrix
    OR we can say that the initial values of shortest distances
    are based on shortest paths considering no
    intermediate vertices """
    dist = map(lambda i : map(lambda j : j , i) , graph)

    """ Add all vertices one by one to the set of intermediate
    vertices.
    ---> Before start of an iteration, we have shortest distances
    between all pairs of vertices such that the shortest
    distances consider only the vertices in the set
    {0, 1, 2, .. k-1} as intermediate vertices.
    ----> After the end of a iteration, vertex no. k is
    added to the set of intermediate vertices and the
    set becomes {0, 1, 2, .. k}
    """
    for k in range(V):

        # pick all vertices as source one by one
        for i in range(V):

            # Pick all vertices as destination for the
            # above picked source
            for j in range(V):

                # If vertex k is on the shortest path from
                # i to j, then update the value of dist[i][j]
                dist[i][j] = min(dist[i][j] ,
                                dist[i][k]+ dist[k][j]
                                )

    printSolution(dist)

# A utility function to print the solution
def printSolution(dist):
    print "Following matrix shows the shortest distances\
between every pair of vertices"
    for i in range(V):
        for j in range(V):
            if(dist[i][j] == INF):
                print "%7s" %("INF"),
            else:
                print "%7d\t" %(dist[i][j]),
        if j == V-1:
            print ""

```

```
# Driver program to test the above program
# Let us create the following weighted graph
"""
```

```
graph = [[0,5,INF,10],
         [INF,0,3,INF],
         [INF, INF, 0, 1],
         [INF, INF, INF, 0]
        ]
# Print the solution
floydWarshall(graph);
```

Output:

Following matrix shows the shortest distances between every pair of vertices

0	5	8	9
INF	0	3	4
INF	INF	0	1
INF	INF	INF	0

## 6) Write a Program for Counting Sort Algorithm in python

Python program for counting sort

```
# The main function that sort the given string arr[] in
# alphabetical order
def countSort(arr):

    # The output character array that will have sorted arr
    output = [0 for i in range(256)]

    # Create a count array to store count of individual
    # characters and initialize count array as 0
    count = [0 for i in range(256)]

    # For storing the resulting answer since the
    # string is immutable
    ans = ["" for _ in arr]

    # Store count of each character
```

```

for i in arr:
    count[ord(i)] += 1

# Change count[i] so that count[i] now contains actual
# position of this character in output array
for i in range(256):
    count[i] += count[i-1]

# Build the output character array
for i in range(len(arr)):
    output[count[ord(arr[i])]-1] = arr[i]
    count[ord(arr[i])] -= 1

# Copy the output array to arr, so that arr now
# contains sorted characters
for i in range(len(arr)):
    ans[i] = output[i]
return ans

# Driver program to test above function
arr = "geeksforgeeks"
ans = countSort(arr)
print "Sorted character array is %s" %("".join(ans))

```

**Sorted character array is eeefggkkorss**

## 7) Write a program for Set Covering Problem

```

def set_cover(universe, subsets):
    """Find a family of subsets that covers the universal set"""
    elements = set(e for s in subsets for e in s)
    # Check the subsets cover the universe
    if elements != universe:
        return None
    covered = set()
    cover = []
    # Greedily add the subsets with the most uncovered points
    while covered != elements:
        subset = max(subsets, key=lambda s: len(s - covered))
        cover.append(subset)
        covered |= subset

    return cover

def main():
    universe = set(range(1, 11))
    subsets = [set([1, 2, 3, 8, 9, 10]),
               set([1, 2, 3, 4, 5]),
               set([4, 5, 7]),
               set([5, 6, 7]),
               set([6, 7, 8, 9, 10])]
    cover = set_cover(universe, subsets)
    print(cover)

```

```
if __name__ == '__main__':  
    main()
```

Output:

```
[set([1, 2, 3, 8, 9, 10]), set([4, 5, 7]), set([5, 6, 7])]
```

#### 8) Write a Program for found a subset with given sum

```
# A recursive solution for subset sum  
# problem  
  
# Returns true if there is a subset  
# of set[] with sum equal to given sum  
def isSubsetSum(set, n, sum) :  
  
    # Base Cases  
    if (sum == 0) :  
        return True  
    if (n == 0 and sum != 0) :  
        return False  
  
    # If last element is greater than  
    # sum, then ignore it  
    if (set[n - 1] > sum) :  
        return isSubsetSum(set, n - 1, sum);  
  
    # else, check if sum can be obtained  
    # by any of the following  
    # (a) including the last element  
    # (b) excluding the last element  
    return isSubsetSum(set, n-1, sum) or isSubsetSum(set, n-1, sum-set[n-1])  
  
# Driver program to test above function  
set = [3, 34, 4, 12, 5, 2]  
sum = 9  
n = len(set)  
if (isSubsetSum(set, n, sum) == True) :  
    print("Found a subset with given sum")  
else :  
    print("No subset with given sum")
```

Output:

```
Found a subset with given sum
```
